

Re-infection rates of *A.lumbricoides*

During the assessment of the reinfection rate of *A. lumbricoides* three months post-treatment with a single dose of ALB (400mg), 46 out of the 52 individuals who were enrolled for the efficacy study were included. The remaining 6 children, 4 of whom remained infected 14-21 days post-treatment (uncured), and 2 of whom were absent during the 3-month post-treatment data collection period, were excluded. Considering these participants, the reinfection rate of *A. lumbricoides* was found to be 34.7% [16/46] with a 95% confidence interval of [21.8% - 47.6%].
